

## **Sql driver mock for Golang**

**sqlmock** is a mock library implementing `sql/driver`. Which has one and only purpose - to simulate any sql driver behavior in tests, without needing a real database connection. It helps to maintain correct TDD workflow.

this library is now complete and stable. (you may not find new changes for this reason)

supports concurrency and multiple connections.

supports go1.8 Context related feature mocking and Named sql parameters.

does not require any modifications to your source code.

the driver allows to mock any sql driver method behavior.

has strict by default expectation order matching.

has no third party dependencies.

**NOTE:** in v1.2.0 `sqlmock.Rows` has changed to struct from interface, if you were using any type references to that interface, you will need to switch it to a pointer struct type. Also, `sqlmock.Rows` were used to implement `driver.Rows` interface, which was not required or useful for mocking and was removed. Hope it will not cause issues.
